A CONCEPTUAL FRAMEWORK OF QUALITY COST CHAIN IN STRATEGIC COST MANAGEMENT

Abstract

Purpose - This study aims to discover a practical and effective way to apply the quality cost concept in Strategic Cost Management (SCM) framework. The interaction of preventive, appraisal, and failure (PAF) activities in a ~~company's-company's~~ internal value chain will be the starting point of SCM implementation. ~~The costs of activities will serve as performance indicators.~~

Design/methodology/approach - This study begins by establishing value chain and quality costs as the scope of conceptual analysis. Discussions on the interrelationships between activities, quality, and costs were gathered to clarify conceptual and practical gaps in the scope of the study. The PAF quality cost model is applied to find viable, practical solutions. The costs of activities will serve as performance indicators.

Findings - The PAF quality cost model depicts opportunities to lower costs and increase profit in a business simultaneously; current poor quality costs are the benchmark. Identifying PAF activities and cost in the business value chain and linking it with others is crucial in evaluating SCM applications. These linkages will generate a Quality Cost Chain (QCC). ~~A higher ratio between potential failure costs and prevention & appraisal costs than the current value is the leading indicator of improvement~~ The leading indicator of improvement is a higher ratio between new possible failure costs (FC) and the combination of prevention & appraisal costs (PAC) than the current value, followed by a lower total quality cost (TQC). ~~A lower ratio between the appraisal and prevention cost is the subsequent attention~~ The subsequent attention is a lower ratio between the appraisal cost (AC) and prevention cost (PC). ~~Mathematically, for assessing the operability of new quality-related activities, $\Delta PAC_{new} < \Delta FC_{new}$, $TQC_{new} < TQC_{current}$, $(FC/PC)_{new} > (FC/PC)_{current}$, and $(AC/PC)_{new} < (AC/PC)_{current}$ are proposed as feasible conditional-quantitative improvement criteria.~~

Originality – ~~The quality-related activity and quality cost issues are still rarely treated as subjects of research studies in the field of Strategic Cost Management.~~ Even so, the discussion tends to be very broad, complex, and difficult to apply. This study combines a simple diagrammatic and mathematical approach to ~~simplify the discussion and, at the same time, manage the value of strategic quality management~~ This study applies the PAF quality cost model in the SCM framework and generates QCC, a visual-mathematical tool, as a practical instrument. The QCC maps the PAF activities in the value chain, visualizes the potential of activity and cost improvement simultaneously and systematically. ~~For assessing the operability of new quality-related activities, $\Delta PAC_{new} < \Delta FC_{new}$, $TQC_{new} < TQC_{current}$, $(FC/PC)_{new} > (FC/PC)_{current}$, and $(AC/PC)_{new} < (AC/PC)_{current}$ are proposed as feasible conditional-quantitative improvement criteria.~~

Practical Implication - QCC will make it easier for managers to evaluate how strategically their departments or activities contribute to quality costs at the departmental or organizational level, as well as to effectively and efficiently improve quality cost performance.

Paper Type Conceptual Paper

1. Introduction

Naturally, there is a cost associated with the activity (Blocher *et al.*, 2019; Cooper and Kaplan, 1992; Janatyan and Shahin, 2020; Shank, 1989). ~~High and ineffective costs, on the other hand,~~ On the other hand, high and ineffective costs are a significant issue for any business. Decreased activity intensity will lower costs but not always enhance profitability, especially in the long run. Business requires better methods to reduce ~~the~~ cost and increase their sustainability simultaneously. Strategic Cost Management (SCM) recommends three analytical pillars for these roles; ~~they are Value Chain Analysis (VCA), Strategic Positioning Analysis (SPA), and Cost Driver Analysis (CDA)~~ (Blocher *et al.*, 2019; Gliubicas and Kanapickienė, 2015; Hertati and Sumantri, 2016; Li, 2018; Sedevich-Fons, 2018; Shank, 1989). **Unfortunately, SCM did not explain a straightforward way to identify the starting point of this improvement (Li, 2018; Shank, 1989). Even the combination of Value Chain Analysis (VCA) and Cost Driver Analysis (CDA), the two of three pillars of SCM, did not show clearly clearly show the costs relationships among activities (Li, 2018);**

Meanwhile, quality is an essential source of competitive advantage, particularly for businesses that operate in highly competitive markets (Blocher *et al.*, 2019; Feigenbaum, 1983; Gliubicas and Kanapickienė, 2015; Heizer *et al.*, 2017; Juran and Godfrey, 1999; Lakhal, 2009; Porter, 1998; Wood, 2013; Yasin *et al.*, 1999). Quality is no longer a function of day-to-day operations but rather of systemic and strategic performance, which is unrelated to the ~~company's~~ company's size (Gliubicas and Kanapickienė, 2015). ~~Internally, poor-quality products generate higher product costs due to inadequate design and production processes. Poor-quality products due to inadequate design and production processes result in higher product costs.~~ Externally, this quality-based problem ~~leading leads~~ to safety problems, lawsuits, and increased government regulation (Ames *et al.*, 2013; Heizer *et al.*, 2017). If undetected and persist in the long term, quality problems can erode the ~~company's~~ company's performance and reputation. ~~Quality becomes a valuable source for growing sales, earnings, and business image when handled quickly, properly, and consistently (Blocher et al., 2019; Heizer et al., 2017; Li, 2018; Sailaja et al., 2014; Wood, 2013). Companies that have not been quantifying quality costs might consider this activity as a step in their efforts to enhance the overall quality of their products and services (Classi, 2015).~~

~~Unfortunately, identifying and analyzing quality costs becomes a complicated task in the implementation stage. In the simulation of quality costs in Southeast Asian semiconductor businesses (Khaled Omar and Murgan, 2014) and quality cost estimation in PCB design (Gilbert et al., 2005), apart from requiring a high degree of mathematical and statistical competence, quality costing tends to be partial and tactical in an organizational setting. A case study on aerosol canister quality has led to the integration of quality-related activities and costs; however, they are still far from effective because they directly place the inspection procedures in the manufacturing stage as the initial and main target of quality cost control (Farooq, 2017). In Iraq, a textile company cannot effectively manage its quality management program because it does not completely understand the link between non-production operations and quality management activities in the production department (Ahmed Al-Dujaili, 2013). A previous conceptual study initiated integrating operational efficiency frameworks with strategic effectiveness. The use of optimal control theory in this study has shown which direction to improve quality and related costs but does not explain how to make it happen (Yasin et al., 1999). Theoretically, out of 99 papers on quality cost analysis, only 45 articles discuss the components of quality costs in detail. Most only focus on the cost of poor quality. This finding supports the hypothesis that gathering quality costs in practical~~

settings can be somewhat unclear and complicated while suggesting further studies on the interrelations of quality costs (Chatzipetrou and Moschidis, 2018). The other study shows that fear of implementing TQM indicates the lack of managerial competency related to quality management, at which quality costing is part of the problem (Bugdol, 2020). A recent study shows managers' lack of interest in new methods is still a significant obstacle to quality cost management (Biadacz, 2021). These studies confirm that companies still require simple but comprehensive techniques for analyzing quality-related activities and costs (Chatzipetrou and Moschidis, 2016; Cheah *et al.*, 2011; Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009).(Cheah *et al.*, 2011)

Surprisingly, research consistently shows that materials and procedures, not employee behavior, are at the core of about 85 percent of product quality concerns (Farooq, 2017; Omachonu *et al.*, 2004; Wood, 2013). Other causes seem to hide under the iceberg (Purushothama, 2012). As a result, when nonconformities arise, quality is viewed as a partial problem, and workers are not considered seriously as a contributing factor. Regardless of the neglect of engineering principles, violations of standard operating procedures, or the continuation of a sub-optimal process on these non-conformity problems, the fact is that there are various issues related to the ineffectiveness of workers behind it ~~Despite the fact that the error is most likely caused by a creative design process that ignores engineering principles, a method that violates standard operating procedures, or the continuation of a suboptimal process, all of which are caused by a lack of worker engagement or ineffectiveness (Choi *et al.*, 2020; Schmitt, 2018).~~ In the context of the value chain, employee empowerment means involving employees in every activity in each chain (Keller *et al.*, 2020; Nguyen *et al.*, 2020; Nikulin *et al.*, 2021). Employees are the organizational members who know best about the quality system's ~~system's~~ weaknesses because they deal with day-to-day operations. Employees have a huge role in ~~the course of~~ quality formation from one chain to another. The facts prove that the involvement of workers has a considerable influence on variations in product quality (Letza and Gadd, 1994; Purushothama, 2012).

Product quality is a measure of a ~~company's~~ company's ability to meet the needs of its customers (Classi, 2015; Dapiran and Kam, 2017; Feigenbaum, 1983; Heizer *et al.*, 2017). Quality criteria and values for each customer can be different. Selecting certain consumer groups will affect the criteria and values of quality standards determined as the criteria and values of the ~~company's~~ company's quality standards. For example, in the e-Retail industry, IT infrastructure has a huge role in providing high-quality customer service as their core competency (Tsai *et al.*, 2013). In addition to maximizing transaction speed and accuracy, IT technology in e-retail is also crucial to identify external failures. For flake, flour, or other oat-based product manufacturers, the effectiveness of quality control in all primary chains will determine customer acceptability.

Comparing the purchase prices of many alternative suppliers forces companies to consider hidden charges in the acquisition cost risk (Gaudenzi *et al.*, 2021; Sato *et al.*, 2020). From a total cost of ownership (TCO) perspective, the quality cost is a hidden cost that arises when a company tries to reduce quality problems due to the price variability of raw materials supplied by its suppliers (Gaudenzi *et al.*, 2021). Due to the natural characteristics of the oat, criteria of quality conformance in oat-based products may have different complexity than non-agricultural products (Ames *et al.*, 2013). Quality cost is a strategic and systematic issue for a business. It requires a practical method to manage efficiently and effectively (Ahmed Al-Dujaili, 2013; Biadacz, 2021; Chatzipetrou and Moschidis, 2016; Chopra and Garg, 2012; Janatyan and Shahin, 2020; Kaplan, 1983; Sailaja *et al.*, 2014; Sedevich-Fons, 2018); without analytical records of quality expenditures, it would be

impossible to establish a reliable estimation or assessment of a company's overall quality costs (Chatzipetrou and Moschidis, 2016; Chopra and Garg, 2012). Based on this, the PAF quality cost model was chosen as the starting point for this study. PAF provides a basic framework that is easy to understand and apply to identify causal relationships in a quality management system.-

Activities and costs related to quality are no longer just operational issue but also a strategic issue that is increasingly important for every company today. Implementing strategic context, specifically strategic cost management, on the quality cost is the first contribution of this conceptual research. The second contribution, which is no less critical, is the new methodology approach. This study proposes a practical analysis technique related to gap research in previous studies regarding the failure of implementing an integrated quality cost measurement method. This study combines a simple mathematical and value chain model-based diagrammatic analysis method. This approach is expected to overcome the complexity of quality management in the company's internal and external value chain linkages. The development of this analytical tool begins by exploring the theoretical role of the value chain and quality costs in the context of SCM, examining the existence of various types of activities in the value chain and their impact on quality costs using a simple mathematical approach, and performing several diagrammatic simulations to visualize and test the logic of the conceptual framework under consideration.

2. **Theories Literature Studies**

Strategic Cost Management

Strategic Cost Management (SCM) is a crucial companion instrument to the cost leadership strategy effectiveness in creating a competitive advantage (Gliubicas and Kanapickienė, 2015; Shank, 1989; Wang, 2019). Value Chain Analysis (VCA), Strategic Positioning Analysis (SPA), and Cost Driver Analysis (CDA) are three pillars of SCM (Blocher *et al.*, 2019; Gliubicas and Kanapickienė, 2015; Hertati and Sumantri, 2016; Li, 2018; Sedevich-Fons, 2018; Shank, 1989). VCA is a method for breaking down company activities, externally and internally, into strategic activity groups, understanding their impact on cost behavior and competitive advantage creation (Bhargava *et al.*, 2018; Li, 2018; Shank, 1989). Activities in the value chain have a strategic impact on product costs (Blocher *et al.*, 2019; Li, 2018; Wouters and Morales, 2014). So basically, the value chain is also an essential input for pricing decisions (Blocher *et al.*, 2019; Kagermann *et al.*, 2015; Yilmaz and Bititci, 2006). Lower product prices than competitors ~~must~~ should reflect the higher productivity of activities within the company (Ahmed Al-Dujaili, 2013; Blocher *et al.*, 2019; Hauck *et al.*, 2021; Jalali *et al.*, 2019; Li, 2018; Wouters and Morales, 2014). SPA recommends the company accomplish managerial accounting from a strategic perspective when making strategic decisions. The company's cost structure should be part of strategic positioning decisions that relate to competitive advantage creation. SPA helps companies evaluate the effectiveness of strategic positioning based on market and internal conditions, including analyzing value creation in the value chain related to its competitive advantage. (Blocher *et al.*, 2019; Li, 2018; Shank, 1989). A cost driver is a factor that can change the amount of a cost (Kaplan, 1983). As the third pillar of SCM, CDA evaluates each cost driver in a strategic and organizational context. By CDA, SCM divides strategic cost drivers into structural and executional cost drivers. Depending on the selected strategic position, each group of activities in a company's value chain has a different strategic cost driver that is connected with varying complexity. Managing key cost drivers for companies that compete on a cost leadership basis is critical (Blocher *et al.*, 2019; Li, 2018; Shank, 1989).

From a managerial accounting perspective, the value chain concept reflects the process of accumulating costs and the flow of value from one activity to another, either from the primary activity to the following primary activity or from the supporting activity to other activities it supports (Li, 2018; Shank, 1989). Because the process of value creation in the primary activity absorbs costs in a specific composition and direction, the costs accumulated in the physical output of the operation activity will be more significant than inbound logistics and so on. In SCM, the value creation ~~that~~-related to suppliers' activities and finished product deliveries to the end-user should be considered (Anthony Jnr, 2019; Li, 2018; Shank, 1989; Zhao *et al.*, 2017).

~~The h~~High quality ~~of a product~~ is impossible to attain without human engagement and deliberate engineering. This quality improvement, primarily concerned with cost-effectiveness, cannot be imposed solely on the operational activity (Feigenbaum, 1983; Juran and Godfrey, 1999). Quality issues in the R&D department might cause the ~~product's~~-product's time-to-market to be longer than planned. Outbound logistics quality issues might cause the goods to arrive late in ~~customers'~~-customers' hands (Lakhal, 2009). Both can have a negative strategic impact on the company. Quality is an element of competitive advantage that must be built through a long and continuous process (Ames *et al.*, 2013; Gliubic and Kanapickienė, 2015).

Value Chain

A value chain reflects value propositions (Li, 2018; Turnbull and McCutcheon, 2019). Differences in value chains between a company with its competitors are a vital source of competitive advantage (Bhargava *et al.*, 2018; Porter, 1998; Tsai *et al.*, 2013). A value is the extent of money those customers are willing to pay for what they receive from the producers; ~~t~~The larger they are willing to pay, the higher the value (Blocher *et al.*, 2019; Dapiran and Kam, 2017; Janatyan and Shahin, 2020; Li, 2018; Porter, 1998) ~~will be~~. Consumer purchasing power is the constraint. A company needs to ~~creating~~-create customer value that exceeds the cost of producing the product. This cost should be lower than the ~~competitor's~~-competitors' cost at an equal value (Blocher *et al.*, 2019; Li, 2018; Vaxevanidis *et al.*, 2009).

A company must be able to adapt to the current environmental conditions. The creation of competitive advantage needs to consider the value contribution of each activity inside the company (Anthony Jnr, 2019; Dapiran and Kam, 2017; Kagermann *et al.*, 2015). According to a study conducted in Australia, marketing and supplier management are linked significantly to product quality and innovation. Process management does not link to product innovation, but R&D management does. Instead, it has a strong connection to product quality. These two findings show that process management is primarily concerned with downstream processes, with the major focus on controlling processes to generate goods that meet pre-determined requirements handled by the R&D division in upstream processes. (Prajogo *et al.*, 2008). **The activities should be separated or grouped. It can be based on differences in the activities' economics of activities, technology, activity costs, or significance of potential value (Li, 2018; Porter, 1998; Zhang, 2005).** Five generic primary activities are inbound logistics, operations, outbound logistics, marketing & sales, and service. Four generic support activities are firm infrastructure, human resources management, technology development, and procurement (Bhargava *et al.*, 2018; Porter, 1998).

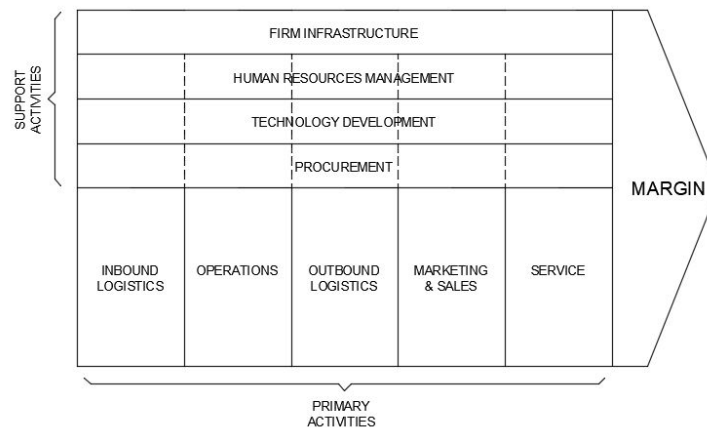

Figure 1. Value Chain (Porter, 1998)

The vertical dotted line indicates that supporting activities such as procurement, technology development, and human resource management can be linked with single primary activities or all of them. The line does not continue in the infrastructure section because this section supports the entire chain (Figure 1). In general, every activity related to value creation uses purchased inputs (materials, energy), human resources, and some form of technology to carry out its functions (Bhargava *et al.*, 2018; Porter, 1998). Every activity absorbs the cost (Blocher *et al.*, 2019; Cooper and Kaplan, 1992). Suppose the activity affects quality, and so does the cost (Wood, 2013).

The value chain complexity of each company is different (Ames *et al.*, 2013; Bhargava *et al.*, 2018; Choi *et al.*, 2020; Janatyan and Shahin, 2020; Yilmaz and Bititci, 2006). The root cause of external failures experienced by e-retailers and customers can be purely from the delivery process in the service activity (Johnson and Whang, 2009; Tsai *et al.*, 2013); it can also come from the carelessness of the packaging department in the outbound logistics (Tsai *et al.*, 2013). Inadequate machine maintenance in the operation chain may result in a high proportion of defective products (Ahmed Al-Dujaili, 2013), otherwise inappropriate material handling in inbound logistics (Sawan *et al.*, 2018). According to contingency theory, the value chain is not static. It can change and should be changed due to environmental and situational uncertainty. No one best control system can be applied to the value chain in all organizations. The application of the proper control system needs to consider the involvement of contextual variables in which the organization exists (Gliubicas and Kanapickienė, 2015; Schniederjans and Schniederjans, 2015; Tsai *et al.*, 2013).

Quality Costs

Quality is a multi-dimensional concept (Feigenbaum, 1983; Lakhal, 2009; Zeng *et al.*, 2015). Quality can relate to performance, features, reliability, conformance, durability, serviceability, aesthetics, or perceived product quality from a customer perspective (Ames *et al.*, 2013; Choi *et al.*, 2020; Classi, 2015; Feigenbaum, 1983; Lakhal, 2009; Prajogo *et al.*, 2008; Purushothama, 2012). A quality problem arises when the customer feels one of their needs is unfulfilled by the product. Then the quality of the product is categorized as poor. This problem can generate additional costs, both for the customer and producer (Blocher *et al.*, 2019; Jalali *et al.*, 2019; Soares *et al.*, 2020; Sturm *et al.*, 2019).

Many people still think that quality costs arise because of the presence of a poor product (Purushothama, 2012; Wood, 2013). Some experts consider calculating the quality costs, especially for poor products, is not advantageous for the company. This opinion can not last long. Researches show that; the proportion of poor quality ranges from 15-30% of product or period cost (Classi, 2015); the quality cost is about 5.64-14.42 percent of the sales revenue in a continuous-process—manufacturing company (Cheah *et al.*, 2011). The high proportion of quality costs in the structure of overall company costs confirms that quality costs can not be ignored, followed by cost reduction actions. However, this process is not simple. About 90% of the quality cost icebergs are hidden underwater (Blocher *et al.*, 2019; Purushothama, 2012; Wood, 2013). Activity-Based Costing (ABC) can effectively identify these costs and quality-related activities (Cooper and Kaplan, 1992; Schiffauerova and Thomson, 2006; Soares *et al.*, 2020; Vaxevanidis *et al.*, 2009).

The other said a poor product indicates the need for corrective actions. ~~The presence of poor products makes Poor products make~~ companies have to spend more money because they cannot sell the product or because they have to incur additional costs to repair the product so that it can be sold (Wood, 2013). If a product is perfectly made, there will be no quality costs. In other words, the cost of quality arises because of imperfections in the product. If there is no product to be repaired, there will be no quality cost. In other words, the quality cost is any cost that would not be incurred if the quality were perfect. Many are increasingly doubtful. Facts show that perfect products or services require activities that absorb costs (Yasin *et al.*, 1999). Quality ~~has an economic value is~~ economically valued (Blocher *et al.*, 2019; Wood, 2013).

Figure 2. PAF Model of Quality Cost

Every cost must be justified in terms of its effectiveness. Even significant parts of the costs of prevention and appraisal, concerning the cost of failure and the total cost, are wastes that must be minimized to the extent feasible if they cannot be eliminated. The PAF quality cost model is chosen in this study due to the most extensively used quality costing classification, emphasizing the polar opposite behavior of preventive and appraisal costs on the one hand and failure costs on the other. ~~Juran developed a PAF quality cost model to accommodate both viewpoints~~ (Blocher *et al.*, 2019; Chatzipetrou and Moschidis, 2018; Feigenbaum, 1983; Heizer *et al.*, 2017; Juran and Godfrey, 1999; Schiffauerova and Thomson, 2006; Shank, 1989; Wood, 2013). Apart from the PAF quality cost model, several models have also been developed and used, such as the opportunity cost model, process cost model, and Activity-Based Costing (ABC) model. The opportunity cost model incorporates the cost of intangible or opportunity losses into a typical PAF model (Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009). The process cost model focuses on processes rather than products or services. This model recognizes the importance of measuring and ownership of process costs, where process costs are the total costs of conformity and non-conformance costs for a particular process (Khaled Omar and Murgan, 2014; Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009). ABC tried to include overhead costs in the quality

costing system because of the limitations of the PAF approach (Khaled Omar and Murgan, 2014; Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009). ABC uses the two-stage procedure to achieve the correct costs of various cost objects, tracing resource costs to activities and then tracing the costs of activities to cost objects (Cooper and Kaplan, 1992; Khaled Omar and Murgan, 2014; Schiffauerova and Thomson, 2006; Soares *et al.*, 2020). Although several other points of view, modifications, and criticisms of the cost of quality theory have been proposed in the literature against the original PAF quality cost model, the categorization of costs in the PAF quality cost model seems quite clear (Chatzipetrou and Moschidis, 2018; Kerfai *et al.*, 2016; Plewa *et al.*, 2016), (Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009)(Schiffauerova and Thomson, 2006; Vaxevanidis *et al.*, 2009)(Vaxevanidis *et al.*, 2009)(Cooper and Kaplan, 1992; Schiffauerova and Thomson, 2006)

However, some cost components could potentially be included in each category. In addition, this categorization also depends on the researcher's objectivity in whether some costs will be classified under one or another category (Chatzipetrou and Moschidis, 2018). In the PAF quality cost model (Figure 2), prevention and appraisal activities are the cost of good quality (PAC), while internal and external failures are the cost of poor quality (FC). The core concept of the PAF quality cost model is that more spending on prevention activities should result in lower failure costs (Chopra and Garg, 2012; Duarte *et al.*, 2016; Soares *et al.*, 2020; Wood, 2013). An accurate assessment of quality costs and their benefits, the trade-off between conformance and non-conformance costs, should be regarded as an essential component of every quality initiative and, therefore, a critical problem for any manager (Schiffauerova and Thomson, 2006).

The activities related to the PAF quality model vary widely. New product reviews, quality planning, quality improvement project, quality training, education, equipment maintenance, product/ process/ service audit, supplier capability survey, and supplier assurance are generic examples of prevention costs (Blocher *et al.*, 2019; Classi, 2015; Feigenbaum, 1983; Gaudenzi *et al.*, 2021; Heizer *et al.*, 2017; Juran and Godfrey, 1999; Lin, 1991; Wood, 2013). Material/ process/ equipment test & inspection activities are related to appraisal costs (Blocher *et al.*, 2019; Heizer *et al.*, 2017; Juran and Godfrey, 1999; Kaplan, 1983; Malik *et al.*, 2016; Wood, 2013; Yasin *et al.*, 1999). Scrap, rework, reinspection, retesting, downgrading, processing customer complaints, customer returns, & warranty claims are parts of failure costs (Blocher *et al.*, 2019; Farooq, 2017; Heizer *et al.*, 2017; Juran and Godfrey, 1999; Wood, 2013).

As Peter Drucker said, we cannot manage what we cannot measure. Quality costs are measurable even though ~~the the~~ quality is not a static business element. Quality improvement is significant for company sustainability (Lakhal, 2009). Improvement of quality-related activities is part of the value chain redesign (Kagermann *et al.*, 2015).- Researches show that the relative proportion of PAF cost is 10:30:60 (Cheah *et al.*, 2011; Malik *et al.*, 2016; Purushothama, 2012). In addition, some activities absorb and hide the quality cost. They include engineering and development, managerial jobs, break times, late delivery of raw materials, increased inventory, decreased capacity, repair of production facilities, late delivery, canceled orders, and customers moving to competitors. Technically, tolerance limits on various quality parameters indicate that quality variations cannot be avoided (Gilbert *et al.*, 2005). Therefore, criteria of good quality must be defined in each activity.

3. Discussion

The value chain has a significant role in mapping the activities within a business and its contribution to creating value for customers. Referring to the principle of Activity-Based Costing (ABC), ~~where~~ which defines activity

as a business element that absorbs costs, the value chain can also map the absorption of costs carried out by each activity (Blocher *et al.*, 2019; Cooper and Kaplan, 1992; Letza and Gadd, 1994; Li, 2018; Vaxevanidis *et al.*, 2009; Wood, 2013). Moreover, because quality costs are part of activity costs, the value chain should also map quality costs within a company.

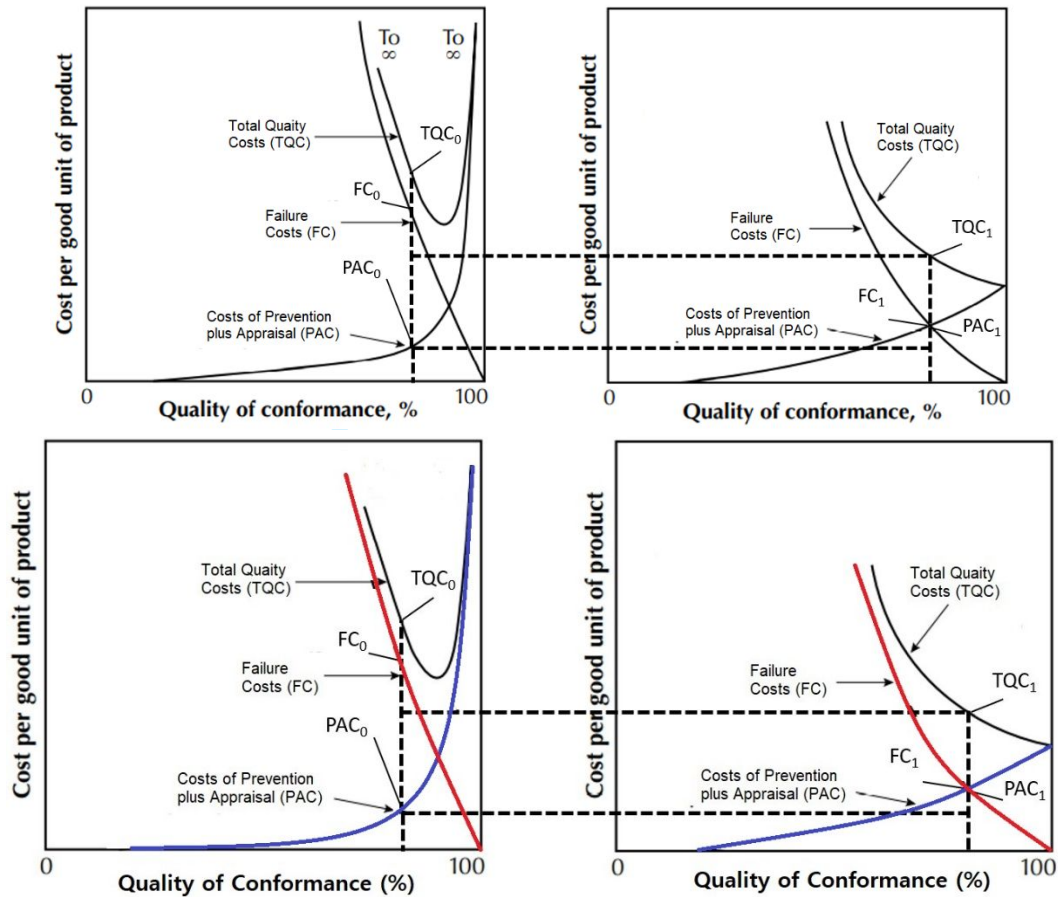

Figure 3. Model of Optimum Quality Costs (Wood, 2013)

Conceptually, the total quality cost (TQC) sums up good ~~quality costs~~ and poor quality costs (Janatyan and Shahin, 2020; Juran and Godfrey, 1999; Wood, 2013). Graphically, we can see the total quality cost is improved with the lower value of the new TQC ($TQC_1 < TQC_0$) at quality conformance (Figure 3). Refers to this model; lower TQC_1 is the effect of a slight increase of new PAC and a considerable decrease of new FC. Meanwhile, PAC is the sum of prevention cost (PC) and appraisal cost (AC). In practice, while $PAC_1 = PAC_0$ ($\Delta PAC = 0$ possibly denotes no additional prevention and appraisal costs), the potential to reduce FC ($FC_1 < FC_0$) may still exist. It means that PAC has a relevant range on TQC appropriateness. This relevant range refers to each ~~PAC's~~ ~~PAC's~~ maximum limit in averting a particular failure cost (relevant range ratio = FC/PAC). The higher this ratio, the more productive the PAC, but this is not unlimited. This ~~proposed~~ ratio is conceptually similar to process capability (Heizer *et al.*, 2017) or functional capability (Gilbert *et al.*, 2005). Another critical issue is the amount of FC in each chain. A primary activity closer to the ultimate value creation activity has greater TQC than the prior one. The TQC will be higher when an FC is identified ~~at-in~~ the sales & marketing activity than ~~in~~ outbound logistics (Janatyan and Shahin, 2020; Juran and Godfrey, 1999; Soares *et al.*, 2020). The FC-related prevention opportunities should be identified in the earlier activities, primary and supporting.

Mathematically, TQC is the sum of Prevention Cost (PC) & Appraisal Cost (AC), and Failure Cost (FC) (Feigenbaum, 1983; Juran and Godfrey, 1999; Wood, 2013; Yasin *et al.*, 1999), formulated as follows;

$$TQC = PC + AC + FC$$

Where:

TQC = Total Quality Cost

PC = Prevention Cost

AC = Appraisal Cost

FC = Failure Cost

Conceptually, PAC is the sum of PC and AC, so that:

$$TQC = PAC + FC$$

Where:

PAC = PC + AC

FC = Failure Cost

Based on [Figure 3](#), TQC_0 is the current total quality cost, while TQC_1 is the new total quality cost (Farooq, 2017; Psomas *et al.*, 2018; Wood, 2013; Yasin *et al.*, 1999). Due to the inverse effect expected between the changes in PAC (ΔPAC) and FC (ΔFC) on TQC, the calculation ~~on~~ of both should be treated differently (Omachonu *et al.*, 2004; Psomas *et al.*, 2018; Vaxevanidis *et al.*, 2009; Wood, 2013). ΔPAC is the difference between new and current Prevention & Appraisal Costs ($PAC_1 - PAC_0$), while ΔFC is between current and new Failure Costs ($FC_0 - FC_1$) (Omachonu *et al.*, 2004; Psomas *et al.*, 2018; Sawan *et al.*, 2018; Vaxevanidis *et al.*, 2009; Wood, 2013).

So that the relationship between TQC_0 and TQC_1 can be depicted as given:

$$TQC_0 = PAC_0 + FC_0, \text{ while } TQC_1 = PAC_1 + FC_1.$$

Where:

TQC_0 = Current Total Quality Cost

PAC_0 = Current Prevention & Appraisal Cost

FC_0 = Current Failure Cost

TQC_1 = New Total Quality Cost

PAC_1 = New Prevention & Appraisal Cost

FC_1 = New Failure Cost

Because of the differing impacts of PAC and FC on TQC, the TQC improvement formula should take this conditional factor into account:

If $\Delta PAC = PAC_1 - PAC_0$ and $\Delta FC = FC_0 - FC_1$ then:

$$TQC_1 = (PAC_0 + \Delta PAC) + (FC_0 - \Delta FC) \text{ or;}$$

$$TQC_1 = (PAC_0 + FC_0) + (\Delta PAC - \Delta FC) \text{ or;}$$

$$TQC_1 = TQC_0 + (\Delta PAC - \Delta FC)$$

If $\Delta PAC < \Delta FC$ then $TQC_1 < TQC_0$, the TQC_1 -related PA activities can be applied.

New and current preventive and appraisal (PA) activities may differ physically, but new and current failure (F) types will likely remain unaltered, indicating that quality increases as PAC increases. For this reason, if a

company spends more on PAC for materials, the result will be an improved quality of material (Omachonu *et al.*, 2004; Sawan *et al.*, 2018). Given TQC1 equations reflect three alternative benchmarks for quality improvement in practice. According to the SCM concept, $\Delta PAC < \Delta FC$ and $TQC_1 < TQC_0$ can be will be proposed determined as conditional references for PA activities improvement on the value chain. The role of rRecording activities and costs related to quality is are crucial (Feigenbaum, 1983; Juran and Godfrey, 1999; Wood, 2013). PAC improvement should be identical to improving the quality of prevention or appraisal activities, which can be primary, supportive, or both. The logic is at least a root cause for each failure, the cause is preventable, and prevention is must be cheaper than failure (Ahmed Al-Dujaili, 2013; Soares *et al.*, 2020; Wood, 2013). The cost of poor quality is the best indicator of inefficient or ineffective activities (Ahmed Al-Dujaili, 2013; Chatzipetrou and Moschidis, 2016; Classi, 2015; Farooq, 2017; Gilbert *et al.*, 2005; Kerfai *et al.*, 2016; Khaled Omar and Murgan, 2014; Omachonu *et al.*, 2004; Purushothama, 2012; Sawan *et al.*, 2018; Soares *et al.*, 2020). Therefore, to reduce TQC, the first target is to reduce FC.

Table 1.- Source of FC

Gilbert <i>et al.</i> (2005)	Electronic Manufacturer		√						√	
Omachonu <i>et al.</i> (2004)	Wire & Cable Manufacturer		√							

Failure to meet the design specification is the most expensive error in the manufacturing sector. At first glance, the root of this failure mostly comes from the primary activity, namely operation or production (Table 1). Many predict this failure comes from component production or assembly process; both are parts of operation activities. A mathematical model developed to calculate the total quality costs even still focuses on the operation activity (Farooq, 2017; Gilbert *et al.*, 2005; Khaled Omar and Murgan, 2014).

In reality, this failure can start from the design process, where the design process is part of the supporting activities in the value chain (Gilbert *et al.*, 2005; Juran and Godfrey, 1999; Wang *et al.*, 2021). Unfulfilled

1
2
3 specifications also stem from the difficulty of suppliers in providing consistent quality raw materials_(**Sato et al.,**
4 **2020**). Manufactured agriculture, plantations, and forestry products often face this problem (Ames *et al.*, 2013).
5
6 This condition can even force producers to market products with lower quality. Although no studies have shown
7
8 a significant relationship between wheat hull color, milled product color, and groats color variation in oat products,
9
10 this color difference is often an important criterion for consumers in determining the quality of oat products (Ames
11 *et al.*, 2013).- Components with ~~more~~ excellent resistance to the applicable quality range will reduce failure rates
12 and otherwise increase direct material costs and possibly subsequent processes.

Even in the same industry, especially in the service industry (Janatyan and Shahin, 2020; Yilmaz and Bititci, 2006), every company may have different references in determining the PAF quality cost relations, but all are detectable and relatively measurable.- A company may place the cost of quality training, which is part of the prevention cost (PC), only on the operation chain. In another company, quality training becomes mandatory in every chain. The same situation can also apply to appraisal cost (AC) and FC. The red cells show the chains at which the activities-related quality cost is usually applied. In a deeper analysis, the yellow cells may have a strong relationship with the given quality costs (Table 2) (Blocher *et al.*, 2019; Choi *et al.*, 2020; Dapiran and Kam, 2017; Farooq, 2017; Honarpour *et al.*, 2018; Purushothama, 2012; Soares *et al.*, 2020; Wood, 2013; Zeng *et al.*, 2015). Many research shows that an information system (IS) can be an infrastructure that supports all quality-related activities (Guimaraes *et al.*, 2007; Johnson and Whang, 2009; Kagermann *et al.*, 2015; Lin, 1991; Sahut *et al.*, 2020; Zhang, 2005). Quality Function Deployment (QFD) can be considered to find this relationship (Choi *et al.*, 2020).

As the name implies, the function of PA activities is to minimize the poor quality output of an activity flowing into the following process. These activities should refer to critical quality attributes (CQA) targeted by the company. The complexities of the activities and CQA vary in different industries (Ames *et al.*, 2013; Gilbert *et al.*, 2005; Purushothama, 2012; Schmitt, 2018). However, when the meaning of poor quality is translated into the form of a tolerance range of quality values that is still acceptable, these quality management activities cannot prevent the closeness of the absolute quality value of a product to the specified tolerance limit (Ahmed Al-Dujaili, 2013; Jalali *et al.*, 2019). Practically, the easiest way to detect quality problems is to know the type and frequency of internal failures that occur in each primary activity and then convert them into monetary value (Khaled Omar and Murgan, 2014; Psomas *et al.*, 2018; Sailaja *et al.*, 2014). The next step can be prevention, appraisal, or a combination of both. The prevention and appraisal actions differ at each link in the chain and evolve (Ahmed Al-Dujaili, 2013; Sawan *et al.*, 2018; Soares *et al.*, 2020). Some methods are outdated. The worst-case design approach is no longer suitable for electronic products in this digital era (Gilbert *et al.*, 2005). Using this method as a prevention activity in the technology and development department is costly, potentially reducing competitiveness (Gilbert *et al.*, 2005).

On the other hand, product Platform Design (PPD) is highly recommended for filling a wide range of market niches while maintaining economies of scale and scope. A product platform is a collection of subsystems and interfaces that constitute a standard structure from which a stream of derivative goods can be efficiently produced and developed. Using PPD, component variations due to design diversity can be reduced; therefore, the potential for quality problems will automatically be reduced (Galizia *et al.*, 2020; Wei *et al.*, 2009).

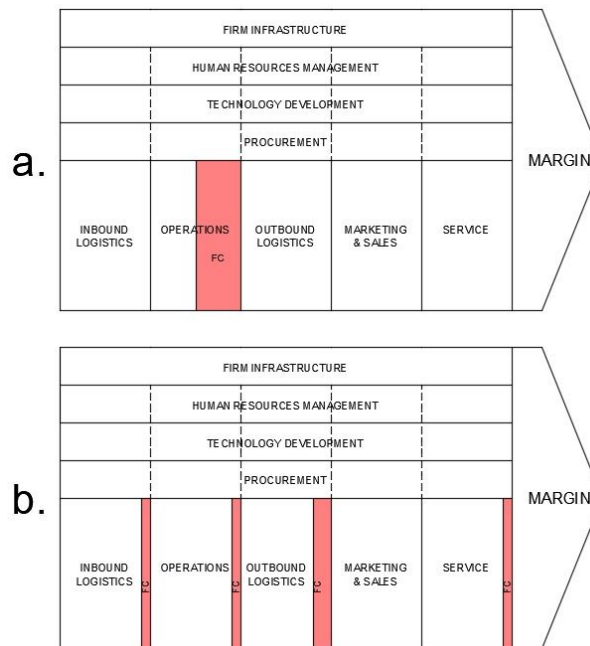

Figure 4. Failure Cost (FC) -Main Activities Linkage

As stated previously, many still think that FC is the only component of quality cost (Classi, 2015; Purushothama, 2012; Wood, 2013). If the failure is in the form of a product defect and occurs in the chain of operations, the conventional step to overcome it is to boost the production of good products. If the same failure occurs in the marketing & sales or service chain, the fastest solution is to replace it with a good product (Blocher *et al.*, 2019; Feigenbaum, 1983; Juran and Godfrey, 1999; Wood, 2013). The source of the problem is still present. In a better way, they map failure cost-main activities linkage inside the operation chain (Figure 4a) (Farooq, 2017; Hauck *et al.*, 2021). Even though they are still focused on FC, several companies ~~began~~ have begun to identify FC in each chain (Figure. 4b) (Ames *et al.*, 2013; Gilbert *et al.*, 2005; Psomas *et al.*, 2018). In practice, it is possible to find this cost in supporting activities (Ahmed Al-Dujaili, 2013; Sawan *et al.*, 2018). The failure cost proportions among primary activities in Figure 4 are simulated.

As the name implies, the function of prevention and appraisal activities is to minimize the poor quality output of an activity flowing into the following process (Ahmed Al-Dujaili, 2013; Chatzipetrou and Moschidis, 2017; Farooq, 2017; Juran and Godfrey, 1999; Sawan *et al.*, 2018; Soares *et al.*, 2020). However, when the meaning of poor quality is translated into a tolerance range of quality indicators that is still acceptable, these activities cannot prevent the closeness of the absolute quality value of a product to the specified tolerance limit (Ahmed Al-Dujaili, 2013; Gilbert *et al.*, 2005; Yasin *et al.*, 1999). This condition increases the probability of internal failure in the following process.

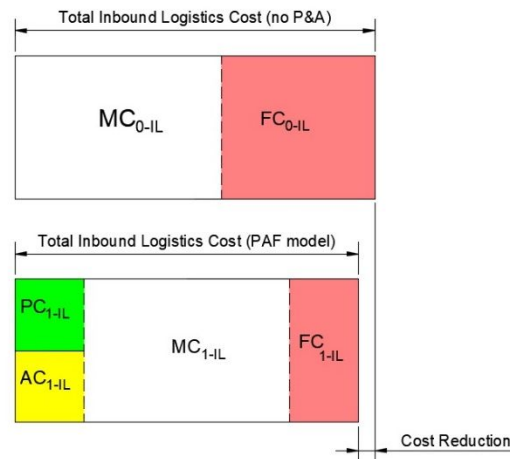

Figure 5. Failure Model vs PAF Quality Cost Model

When the proportion of FC in a chain is troublesome, FC_{0-IL} in Inbound Logistics (IL), for example, meanwhile the performance of the main activity (MC_{0-IL}) is unchanged; the PAF quality cost model becomes a quality management model that is considered for quality cost reduction (Figure 5). In this case, the current main activity cost (MC_{0-IL}) is assumed to be the same as the main activity cost in the PAF model (MC_{1-IL}).

Due to FC reduction as the primary target, the first step in PAF quality cost model implementation is to identify the type of failure in each key-value creation chain (Soares *et al.*, 2020; Sturm *et al.*, 2019; Wood, 2013). The second is to determine the FC internally or externally. Internal FC is possibly found in all primary activities; external FC begins in the marketing/ sales or service associated with the value chain (Table 2). The third step is to identify the preceding primary activity directly related to the failure and deploy it into sub-activities. The fourth step is charting each one's-one's relationship to the other sub-activities. The fifth step is to identify appropriate prevention and appraisal initiatives. Then, inside and between primary and supporting activity categories, identify the related PC, AC, FC, and important executional and operational cost drivers (Blocher *et al.*, 2019; Li, 2018; Soares *et al.*, 2020). After examining the existing quality problem-activity linkages, finding a lower PAC. Finally, figure out how much FC is if failure happens. If the cost savings of the alternative FC are greater than the previous, suggest these additional PA activities or find a better alternative. This PAF quality cost improvement map, the so-called Quality Cost Chain (QCC), can be classified as a value chain redesign (Kagermann *et al.*, 2015). QCC is a driver of innovation directly (Honarpour *et al.*, 2018; Zeng *et al.*, 2015) or indirectly (Schniederjans and Schniederjans, 2015).

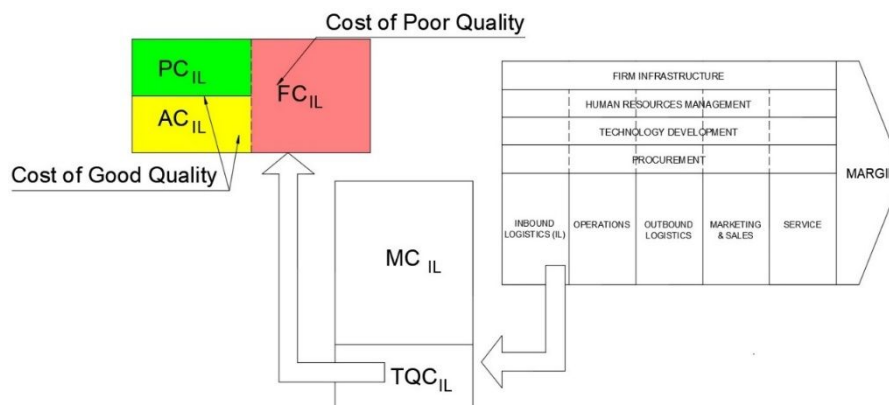

Figure 6. PAF as Centralized Activity and Cost

It is nearly difficult for any company to ignore the presence of technology in every value-creation activity. Meanwhile, the wide range of technical capabilities accessible on the market significantly establishes competitive advantages, particularly quality-related ones. These technologies can be specifically designed to improve the performance of specific primary or supporting operations and serve as a connection across activities to optimize value (Bhargava *et al.*, 2018). Quality-related activities, which can be primary, supportive, or both, should be improved with PAC improvement. In the inbound logistic (IL) case, ΔPAC may reflect the increases in PC_{IL} and AC_{IL} . At the same time, ΔFC indicates a decrease in FC_{IL} . The improvement of TQC in Inbound Logistics is confirmed if the new TQC_{IL} is lower than the previous. The PAF activities improvement can be centralized as a single sub-activity in primary or supporting activities (Figure 6).

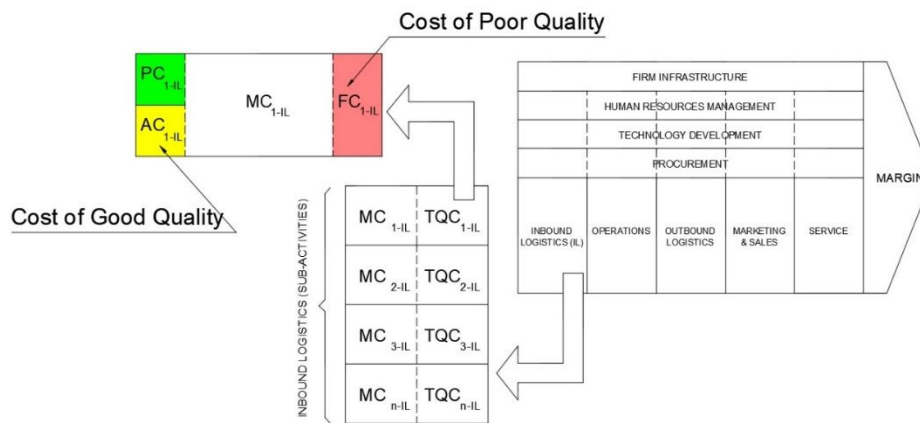

Figure 7. PAF as Distributed Activities and Cost

The PAF activities improvement is also possibly distributed in many sub-activities in the Inbound Logistics (IL) chain, such as TQC_{1-IL} , TQC_{2-IL} , TQC_{3-IL} , and so on (Figure 7).- For example, the total cost of an inbound logistics sub-activity (TC_{1-IL}) consists of PC_{1-IL} , AC_{1-IL} , MC_{1-IL} , and the internal FC_{1-IL} . Some generic main sub-activities in inbound logistics cases are receiving raw materials from suppliers, transporting, storing, and releasing them from the warehouse, scheduling vehicles, and maintaining warehouses. Zero defect may happen, but not zero quality cost or free as stated in some literature (Plewa *et al.*, 2016). PC and AC will happen even minimum. Theoretically, the minimum TQC in the PAF model consists of PAC ($FC=0$). In the SCM, the number of activities related to poor quality and PA activities related to the good product can be defined as executional cost drivers. Test capability is an essential parameter in the technology development chain, categorized as support activities (Gilbert *et al.*, 2005). This parameter can be set as one of the prevention activities cost-drivers in the technology & development chain.

The model of optimum quality costs (Figure 3) does not indicate the effect of TQC improvement on the total cost of the activity (TC). After all, a successful PAF improvement will also improve Total Cost (TC) (Chatzipetrou and Moschidis, 2016; Omachonu *et al.*, 2004; Sawan *et al.*, 2018). A mathematical approach based on centralized PAF activities (Figure 6) shows the way a new TQC improved the total cost ~~on~~ of the inbound logistic (TC_{IL}):

$$TC_{IL_0} = (PC_{IL_0} + AC_{IL_0}) + MC_{IL_0} + (FC_{IL_0}) \text{ or;}$$

$$TC_{IL_0} = PAC_{IL_0} + MC_{IL_0} + FC_{IL_0} \text{ or;}$$

$$TC_{IL_0} = TQC_{IL_0} + MC_{IL_0}$$

Where:

TC_{IL_0} = Total cost of the inbound logistic activity (0 indicates current TC on inbound logistics)

PC_{IL_0} = The prevention cost of the inbound logistic (current)

AC_{IL_0} = The appraisal cost of the inbound logistic activity (current)

MC_{IL_0} = The main cost of the inbound logistic activity (current)

FC_{IL_0} = The internal failure cost of the inbound logistic activity (current)

$PAC_{IL_0} = PC_{IL_0} + AC_{IL_0}$

$TQC_{IL_0} = PAC_{IL_0} + FC_{IL_0}$

The total cost of inbound logistics after improvement is $TC_{IL_1} = (PC_{IL_1} + AC_{IL_1}) + MC_{IL_1} + (FC_{IL_1})$. The explanation of each notation in TC_{IL_1} is similar to TC_{IL_0} .

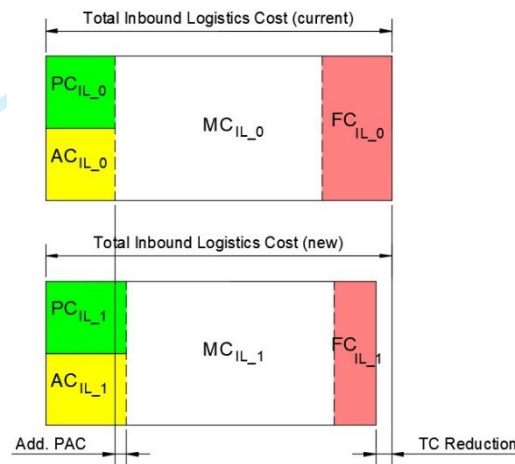

Figure 8. PAF Improvement and Total Cost (TC) Reduction

The arrangement of PAF activities and the main activity related to each other, the so-called QCC (Quality Cost Chain), will facilitate the analysis process (Figure 8). This example assumes no modification in the main activity, so the cost is unchanged ($MC_{IL_0} = MC_{IL_1}$). 0 and 1 refer to current and new PAF activities, respectively.

Mathematically;

If $((PC_{IL_1} + AC_{IL_1}) - (PC_{IL_0} + AC_{IL_0})) < (FC_{IL_0} - FC_{IL_1})$ then $(TQC_{IL_1} < TQC_{IL_0})$.

If $(TC_{IL_1} = TQC_{IL_1} + MC_{IL_1})$ while $(MC_{IL_0} = MC_{IL_1})$ then $(TC_{IL_1} = TQC_{IL_1} + MC_{IL_0})$

Finally, if $(TQC_{IL_1} < TQC_{IL_0})$ then $TC_{IL_1} < TC_{IL_0}$, the total cost has decreased in Inbound Logistics.

A lower total cost of the activity (TC), primary or supporting, results from lower total quality-cost (TQC) or higher ratio FC to PAC ($FC_{current}/PAC_{current} < FC_{new}/PAC_{new}$). In practice, this lower TQC potentially improves product return rate, lower inventory, lower manufacturing cost, higher perceived value, more satisfied customers, and faster throughput time (Blocher *et al.*, 2019; Kagermann *et al.*, 2015; Schniederjans and Schniederjans, 2015; Zhang, 2005). QCC helps businesses lowering TQC that has a specific relation with TQC, which is related to strategic performance.

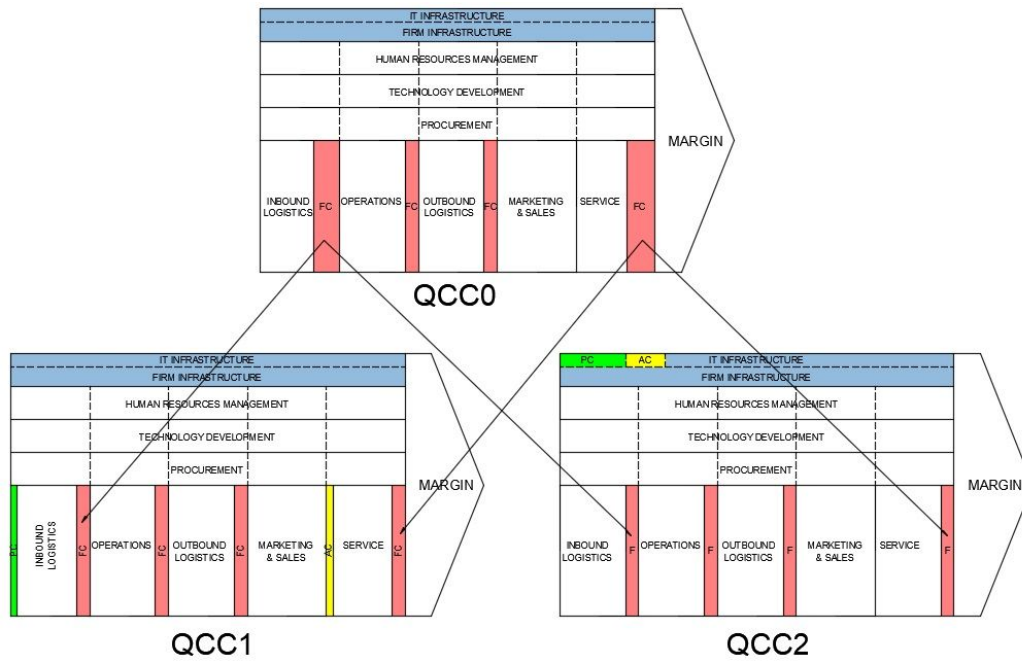

Figure 9. Various QCCs with Equal TQC

According to [Error! Hyperlink reference not valid. Table 2](#), in the e-retailer case (Johnson and Whang, 2009; Tsai *et al.*, 2013), prevention and appraisal capabilities can be centralized at-in the IT infrastructures chain or distributed among primary activities (Figure 9). PAF cost proportion and distribution in this example is just a simulation. Both alternative QCCs, QCC1 and QCC2, have different consequences from the SCM point of view, so does the competitive advantage (Blocher *et al.*, 2019; Schniederjans and Schniederjans, 2015; Zhang, 2005). In this case, the goal of the new quality management system is to lower FC in inbound logistics and service chains. QCC1 develops some-prevention activities directly at the inbound logistic and appraisal activities throughout the service chain. During their time at QCC2, the company implements prevention and evaluation modules into their IT infrastructure. These new modules are linked to an inbound logistics and services inspection hardware system.

By assuming the failure cost reduction (ΔFC) may be equal between QCC1 and QCC2 implementation, then;

$$\Delta FC_{QCC1} = \Delta FC_{QCC2}, \text{ so that } FC_{QCC0} - FC_{QCC1} = FC_{QCC0} - FC_{QCC2}.$$

Either; the total of PAF activities improvement at QCC1 is equal to the total of PAF improvement at QCC2, or:

$$TQC_{QCC1} = TQC_{QCC2}, \text{ then;}$$

$$TQC_{QCC1} = PAC_{QCC1} + FC_{QCC1}, \text{ and } TQC_{QCC2} = PAC_{QCC2} + FC_{QCC2}.$$

$$\text{So that } PAC_{QCC1} + FC_{QCC1} = PAC_{QCC2} + FC_{QCC2}.$$

Another alternative of QCC can be developed so that the generic equation will be:

$$PAC_{QCC1} + FC_{QCC1} = PAC_{QCC2} + FC_{QCC2} = PAC_{QCC3} + FC_{QCC3} = PAC_{QCCn} + FC_{QCCn}$$

This equation confirms that the different QCCs with equal TQC can be generated to solve the same quality problems. Similar to the previous e-retailer case, internal failure due to the assembly-disassembly process in the chain of operations, sales & marketing, and service may be overcome by implementing PPD in the technology

development chain (Galizia *et al.*, 2020; Gliubicas and Kanapickienė, 2015; Wei *et al.*, 2009). In SCM, the PPD method can be a prevention activity applied in the supporting activities. Generally speaking, from quality cost in the short-run perspective, we can choose one with equal financial consequences or slightly different. However, ~~when it becomes a strategic matter, the system development complexity can be very different~~ the system development complexity can be very different when it becomes a strategic matter. Quality factors of the end product at the consumer level will ultimately determine the value and marketability. Quality is not just an operational or manufacturing industrial problem. - The entire value chain must be considered to secure a reliable and consistent flow of quality that fulfills finished product specifications (Ames *et al.*, 2013), including marketing & sales, and service chains (Lakhal, 2009).

The responsibility for implementing and achieving quality improvement targets in QCC1 applies to specific chains or sections. Prevention is a matter for inbound logistics, while appraisals are ~~a matter~~ for the service department. Cost Driver, both executional and operational, in the two chains, of course, will be different. On QCC2, ~~prevention and appraisal matters are handled directly by the IT infrastructure chain~~ the IT infrastructure chain handles prevention and appraisal matters directly. ~~The implementation of these activities may still be carried~~ outse activities may still be implemented by workers in the inbound logistics chain and service chain. Nevertheless, the responsibility of the PAF remains on the IT infrastructure developer. This way, these two ~~activities'~~ activities' executional and operational cost drivers will now be fully embedded in the IT infrastructure chain.

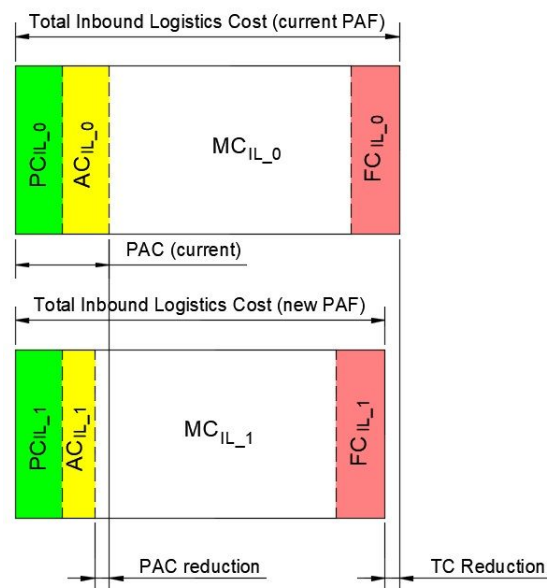

Figure 10. PAC and TC Reduction

The selection of prevention and appraisal activities ~~itself~~ can be a strategic decision in quality management. Practically, prevention activities can significantly reduce appraisal costs (AC) (Chatzipetrou and Moschidis, 2016; Chopra and Garg, 2012; De, 2009; Farooq, 2017; **Pasquini *et al.*, 2020**; Purushothama, 2012; Ramdeen *et al.*, 2007; **Wang *et al.*, 2021**). Table 2. can be an initial reference to find the relationship between the prevention and appraisal activities relation optimization. For example, quality management activities and cost administration are essential for the quality improvement program. If performed manually, it will be resource exhausted. An integrated quality management information system is highly recommended (Guimaraes *et al.*, 2007; Johnson and Whang,

2009; Lin, 1991; Sahut *et al.*, 2020). It will potentially reduce AC, TQC, and TC simultaneously in a chain (Figure 10). Slightly different from Figures 5, 6, 7, and 8, PC and AC in Figure 10 are drawn vertically to make it easier to visualize the impact of changes in PAC, TQC, and TC. Following FC/PC, a lower AC/PC ratio might be the second quality improvement criterion based on this PAC depiction.

New product design and customization, new materials, new machine operators, new process setups, and new technologies will result in new quality issues (Chatzipetrou and Moschidis, 2016; Choi *et al.*, 2020; Galizia *et al.*, 2020; Wei *et al.*, 2009). The old quality issues may be resolved by implementing new conditions, but a new one may emerge. The one-time cost of prevention is no longer effective. The expense of prevention lasts a lifetime. ~~To investigate such new relationships, the organization must re-create a new QCC map~~ the organization must re-create a new QCC map to investigate such new relationships.

4. Conclusions and Implications

Conclusions

~~Quality~~ The Quality Cost Chain (QCC) is the sub-set of an internal business Value Chain. QCC effectively maps the linkages between activities and quality cost ~~that makes, making~~ Strategic Cost Management applicable. ~~Conceptually t~~ These linkages can be modified to develop are valuable sources for ~~a business's~~ innovation (Dapiran and Kam, 2017; Gliubiccas and Kanapienkienė, 2015; Honarpour *et al.*, 2018), competitive advantage (Blocher, 2019; Lakhali, 2009; Porter, 1998; Wood, 2013), and sustainability (Anthony Jr, 2019; Heizer *et al.*, 2017; Li, 2018; Porter, 1998; Sturm *et al.*, 2019). The primary executional goal of strategic quality improvement is to reduce failure costs, both internally and externally, ~~internal and external failure costs in the long run.~~ The relationship between failure cost and all activities in the value chain that contribute to failure prevention must be mapped by a business. This activity is a dynamic process that might be unique to each firm.

Due to its strategic consequences, a business needs to identify, manage, evaluate carefully, and modify the economics of quality in its value chain. The focus of strategic quality improvement is creating practical prevention activities. The ratio between potential failure costs (FC) and prevention & appraisal costs (PAC) can be considered for altering prevention and appraisal activities, and applying new quality processes or technology with the condition that the new total quality cost is lower than the current. ~~Lower AC/PA ratio at equal FC/PAC is the second important consideration~~ The second important consideration is the lower AC/PA ratio at equal FC/PAC. Although the costs of the primary value-added activities may stay unchanged, a higher FC/PAC ratio following the new executional quality management activities might lower the total cost of a value chain. Last, it is crucial to conduct a long-term investigation of the new possible quality concern ~~Last, it is crucial to conduct a long-term investigation of the new possible quality concern.~~

Implications

This study has practical implications. Company managers can quickly analyze the strategic contribution of their departments or activities to quality costs at the departmental or organizational level using the QCC map. This map helps managers identify the linkage between activities and quality cost in all value chains, improve it in a centralized or distributed manner by considering FC/PAC, TQC, FC/PC, and AC/PA, respectively, and

monitor them. Of course, as an inter-departmental analysis instrument, the detail and the completeness of related information, such as costs and activities, have a vital role.

This research has limitations. This study only discusses the relationship between quality costs and activities related to quality management in the PAF quality cost model, not cost behavior. This limitation opens up opportunities for future research that intends to link QCC with cost behavior in the context of managerial accounting and Strategic Cost Management. The use of QCC in certain industrial areas is the next research opportunity. The variety of PAF activities this study addresses originates from a wide range of industrial sectors; QCC research by sector may produce unique industrial quality cost phenomena.

The TQM Journal

Author responses to the reviewer(s)' comments:**Comments:****Comment V1:**

Page 1/30 lines 35-38, "For assessing the operability..... conditional-quantitative improvement criteria", This information refers to the findings of the study.

Author's response:

This information ("For assessing the operability..... conditional-quantitative improvement criteria") has been moved into the findings of the study.

Reviewer comment R1:

Well addressed. However, the problem is that the acronyms used are not understandable to the reader. Please make the acronyms understandable.

Author response:

Thank you, The acronyms have been inserted in the fourth and fifth sentences in Findings to improve reader understanding. "Mathematically" also has been added to the following sentence so that the paragraph has changed into: "The leading indicator of improvement is a higher ratio between new possible failure costs (FC) and the combination of prevention & appraisal costs (PAC) than the current value, followed by a lower total quality cost (TQC). The subsequent attention is a lower ratio between the appraisal cost (AC) and prevention cost (PC). Mathematically, for assessing the operability of new quality-related activities, $\Delta PAC_{new} < \Delta FC_{new}$, $TQC_{new} < TQC_{current}$, $(FC/PC)_{new} > (FC/PC)_{current}$, and $(AC/PC)_{new} < (AC/PC)_{current}$ are proposed as feasible conditional-quantitative improvement criteria.

Reviewer comment R2:

Well addressed. However, a question arises: Does a higher ratio between new possible failure costs (FC) and the combination of prevention & appraisal costs (PAC) than the current value denote an improvement?

Author response:

Thank you. A higher ratio between new possible failure costs (FC) and the combination of prevention & appraisal costs (PAC) than the current value denotes an improvement is true, with the condition that the new total quality cost (TQC1) is lower than the current (TQC0). I have stated this condition in the Abstract (findings) and in the discussion (P10) (... If $PAC < \Delta FC$, then $TQC1 < TQC0$, the TQC1-related PA activities can be applied...).

According to the comment, I have added: "...with the condition that the new total quality cost is lower than the current" in the second paragraph of the conclusion.

Comment V1:

What the authors state in the Originality paragraph deals mostly with the findings and the practical implications of the study. In the Originality paragraph the authors should highlight clearly why and how the present study is different from the studies conducted worldwide so far.

Author's response:

This paragraph has been changed into "Although it has become one of the important topics in SCM, research on quality and quality cost issues is still rarely treated as a strategic

1
2
3 management issue. Even so, the discussion tends to be very broad, complex, and difficult to
4 apply. This study combines a simple diagrammatic and mathematical approach to simplify the
5 discussion and at the same time manage the value of strategic quality management"

7 **Reviewer comment R1**

8 Well addressed. Page 1/52, lines 35-37, "...research on quality-related activity and quality
9 cost issues is still rarely treated as a strategic management issue", Based on this sentence it
10 seems that the research itself is a strategic management issue. For example, it can be
11 changed as follows: the quality-related activity and quality cost issues are still rarely treated
12 as subjects of research studies in the field of strategic cost management.
13

14 **Author's response:**

15 Thank you. The sentence has been changed into:

16 "The quality-related activity and quality cost issues are still rarely treated as subjects of
17 research studies in the field of strategic cost management."
18

19 **Reviewer comment R2**

20 Well addressed
21

22 **Author's response:**

23 Thank you.
24

25 **Comment V1:**

26 Please provide a separate paragraph in the Abstract presenting the Practical implications of
27 the study. In this paragraph the authors should clearly highlight how the present study findings
28 can be used by company managers in their daily business life.
29

30 **Author's response:**

31 Here is the addition of the practical implications; "QCC will make it easier for company
32 managers to analyze the contribution of their departments or activities to quality costs at the
33 departmental or organizational level, including making quality cost performance improvements
34 effectively and efficiently."
35

36 **Reviewer comment R1**

37 Well addressed.

38 Page 1/52, line 50-52, "...including making quality cost performance improvements effectively
39 and efficiently", Please re-phrase and check the full-stop.
40

41 **Author's response:**

42 Thank you. The sentence has been re-phrased into:

43 "QCC will make it easier for managers to evaluate how strategically their departments or
44 activities contribute to quality costs at the departmental or organizational level, as well as to
45 effectively and efficiently improve quality cost performance."
46

47 **Reviewer comment R2**

48 Well addressed
49

50 **Author's response:**

51 Thank you.
52

Comment V1:

Page 1/30 lines 48-57, Please support through references all the statements presented in this paragraph.

Reviewer comment R1

Page 1/52, line 13-16, "Unfortunately, SCM did not explain a straightforward..... relationships among activities", These lines should also be supported with references. Also, check the full-stop.

Author's response:

Thank you. Two primary SCM-related references (Li, 2018 and Shank, 1989) have been added to these sentences. The sentences now are:

"Unfortunately, SCM did not explain a straightforward way to identify the starting point of this improvement (Li, 2018; Shank, 1989). Even the combination of Value Chain Analysis (VCA) and Cost Driver Analysis (CDA), the two of three pillars of SCM, did not show clearly the costs relationships among activities (li, 2018)".

Reviewer comment R2

Well addressed

Author's response:

Thank you.

Comment V1:

Page 1/30 line 59, The literature references should be presented from the older to the newest. Please check the literature references throughout the text.

Reviewer comment R1:

Not well addressed. Please check the literature references throughout the text.

Author's response:

Dear reviewer, I used Zotero software for automatic citation insertion according to Harvard-Emerald style as guided in the TQM journal Author Guidelines (<https://www.emeraldgrouppublishing.com/journal/tqm#author-guidelines0>). This citation styles suggest alphabetical order in each list of citation. That is why the references are not in the year of publishing order. Thank you.

Reviewer comment R2:

Well addressed

Author's response:

Thank you.

Comment V1:

Page 2/30 lines 13-16, "Surprisingly, research consistently..... a contributing factor", Please support these lines through references.

Reviewer comment R1:

Page 2/52, lines 58-59, Not well addressed.

Author's response:

1
2
3 Thank you. Three references (Farooq, 2017; Omachonu et al., 2004; Wood, 2013) have been
4 added to the sentence. A new sentence with reference (Purushothama, 2012) was also added
5 to confirm the previous argument theoretically.
6

7 “Surprisingly, research consistently shows that materials and procedures, not employee
8 behavior, are at the core of about 85 percent of product quality concerns (Farooq, 2017;
9 Omachonu et al., 2004; Wood, 2013). Other causes seem to be hiding under the iceberg
10 (Purushothama, 2012).”
11

12 **Reviewer comment R2:**

13 Well addressed
14

15 **Author’s response:**

16 Thank you.
17

18
19 **Comment V1:**

20 Page 2/30 lines 16-20, “Despite the fact that the error..... engagement or
21 ineffectiveness”, Please check the syntax.
22

23 **Reviewer comment R1:**

24 Page 3/52, lines 3-7, Not well addressed.
25

26 **Author’s response:**

27 Thank you. The syntax has been checked and improved.
28 “Regardless of the neglect of engineering principles, violations of standard operating
29 procedures, or the continuation of a sub-optimal process on these non-conformity problems,
30 the fact is that there are various issues related to the ineffectiveness of workers behind it.”
31
32

33 **Reviewer comment R2:**

34 Well addressed
35

36 **Author’s response:**

37 Thank you.
38

39
40 **Comment V1:**

41 Page 2/30 lines 20-26, “In the context of the value chain..... variations in product quality”,
42 Please support these lines through more recent references.
43

44 **Reviewer comment R1:**

45 Page 3/52, lines 7-14, Not well addressed.
46

47 **Author’s response:**

48 Thank you. I have added three references to support this statement. They are:
49

- 50 1. Keller, S.B., Ralston, P.M. and LeMay, S.A. (2020), “Quality Output, Workplace
51 Environment, and Employee Retention: The Positive Influence of Emotionally Intelligent
52 Supply Chain Managers”, Journal of Business Logistics, Vol. 41 No. 4, pp. 337–355.
- 53 2. Nguyen, D.D., Le, T.M. and Kingsbury, A.J. (2020), “Farmer participation in the lychee
54 value chain in Bac Giang province, Vietnam”, Journal of Agribusiness in Developing and
55 Emerging Economies, Vol. 10 No. 2, pp. 203–216.
- 56 3. Nikulin, D., Wolszczak-Derlacz, J. and Parteka, A. (2021), “Working Conditions in Global
57 Value Chains: Evidence for European Employees”, Work, Employment and Society, p.
58 095001702098610.
59
60

1
2
3 So that the sentence now is:
4

5 "In the context of the value chain, employee empowerment means involving employees in
6 every activity in each chain (Keller et al., 2020; Nguyen et al., 2020; Nikulin et al., 2021)."
7

8 **Reviewer comment R2:**

9 Well addressed

10 **Author's response:**

11 Thank you.
12
13

14
15 **Comment:**

16 The introduction section is not comprehensive. The Quality Cost and its dimensions, even
17 though constitutes the core of the present study, they are not adequately presented in the
18 Introduction section. An issue that should be carefully considered by the authors in the
19 Introduction section (prior to the Literature review section) concerns the stimulus of the authors
20 to carry out the present study. In other words, the gap identified in the literature and the future
21 research proposals suggested by several authors (based on which the authors have been
22 motivated to conduct the present study) should be clearly highlighted in the Introduction
23 section (using recent references). So, the reviewer suggests the authors further review the
24 literature, in order to identify the literature gap (according to which no previous similar studies
25 have been carried out so far) and the suggestions of several authors to carry out a study
26 similar to the study presented in this paper.
27
28

29
30 **Author's response:**

31 A paragraph has been added to clarify the literature gap ("Quality becomes a valuable source
32 for growing sales, earnings, and business image when handled quickly, properly, and
33 consistently (Blocher, 2019; Heizer et al., 2017; Li, 2018; Sailaja et al., 2014; Wood, 2013).
34 Companies that have not been quantifying quality costs might consider this activity as a step
35 in their efforts to improve the overall quality of their products and services (Classi, 2015).
36 Unfortunately, identifying and analyzing quality costs becomes a complicated task in the
37 implementation stage. In the simulation of quality costs in Southeast Asian semiconductor
38 businesses (Khaled Omar and Murgan, 2014) and quality cost estimation in PCB design
39 (Gilbert et al., 2005), apart from requiring a high degree of mathematical and statistical
40 competence, quality costing tends to be partial and tactical in an organizational setting. A case
41 study on aerosol canisters quality has led to the integration of quality-related activities and
42 costs; however, they are still far from effective because they directly place the inspection
43 procedures in the manufacturing stage as the initial and main target of quality cost
44 control (Farooq, 2017). A textile company in Iraq cannot effectively manage its quality
45 management program because it does not completely understand the link between non-
46 production operations and quality management activities in the production department
47 (Ahmed Al-Dujaili, 2013). A previous conceptual study initiated integrating operational
48 efficiency frameworks with strategic effectiveness. The use of optimal control theory in this
49 study has shown which direction to improve quality and related cost but does not explain how
50 to make it happen (Yasin et al., 1999). Companies still need an easy-to-use technique of
51 assessing activities and quality costs that is thorough but not so excessively."
52
53
54
55
56

57 **Reviewer comment R1:**

58 Page 2/52, lines 52-57, "Companies still need an.....not merely administrative innovation",
59 Please check this sentence for syntax error.
60

1
2
3 The previous comments of the reviewer regarding the literature gap and the future research
4 proposals of several authors, are not adequately and well addressed by the authors. Please
5 read carefully the previous comments of the reviewer. The authors should identify in the
6 literature specific statements presenting that there is an existing literature gap (statements
7 such as for example: there is lack of studies.....no research studies define..... there is a dearth
8 of studies.....) as well as specific statements – suggestions made by several authors recently
9 for future studies in the topic (such as: there is a need for further studies.....more studies can
10 be conducted in the field).

11
12
13 The references used should be recent. In the revised paragraph the authors present, the
14 majority of the literature references are not so recent.

15
16
17 **Author's response:**

18 Thank you. I have modified the sentence. I also have adopted specific statements from three
19 recent articles on a time basis (Chatzipetrou and Moschidis, 2018; Bugdol, 2020; Biadacz,
20 2021) to present the literature gap.

21
22 So that the paragraph related to the literature gap is:

23 "Theoretically, out of 99 papers on quality cost analysis, only 45 articles discuss the
24 components of quality costs in detail. Most only focus on the cost of poor quality. This finding
25 supports the hypothesis that gathering quality costs in practical settings can be somewhat
26 unclear and complicated while suggesting further studies on the interrelations of quality costs
27 (Chatzipetrou and Moschidis, 2018). The other study shows that fear of implementing TQM
28 indicates the lack of managerial competency related to quality management, at which quality
29 costing is part of the problem (Bugdol, 2020). A recent study shows that managers' lack of
30 interest in new methods is still a significant obstacle to quality cost management (Biadacz,
31 2021). These studies confirm that companies still require simple but comprehensive
32 techniques for analyzing quality-related activities and costs (Chatzipetrou and Moschidis,
33 2016; Cheah et al., 2011; Schiffauerova and Thomson, 2006; Vaxevanidis et al., 2009)."

34
35
36 **Reviewer comment R2:**

37 Well addressed

38
39 **Author's response:**

40 Thank you.

41
42
43 **Comment:**

44 Why and how the present study differs from previous studies published so far, should also be
45 clearly highlighted in the Introduction section. The contribution of the study should also be
46 clearly highlighted in the Introduction section.

47
48
49 **Author's response:**

50 The contribution of this study has been added to the last paragraph in Introduction section
51 ("Quality-related activities and costs are strategic and operational issues that are increasingly
52 important for every company today. This study proposes an effective and comprehensive
53 quality cost and activity analysis tool to compensate for very dynamic and complex business
54 conditions but is relatively easy to understand and implement").

55
56
57 **Reviewer comment R1:**

58 Not well addressed in terms of the originality of the study. Why and how the present study
59 differs from previous studies published so far, should also be clearly highlighted in the
60 Introduction section.

Author's response:

Thank you. According to your previous comment on the literature gap, I think now I have a better understanding of my research's potential contributions. Strategic context implementation in quality cost analysis is the first contribution, and the new methodology approach is the second. So that I have changed the paragraph into: "Activities and costs related to quality are no longer just an operational issue but also a strategic issue that is increasingly important for every company today. Implementing strategic context, specifically strategic cost management, on the quality cost is the first contribution of this conceptual research. The second contribution, which is no less critical, is the new methodology approach. This study proposes a practical analysis technique related to gap research in previous studies regarding the failure of implementing an integrated quality cost measurement method. This study combines a simple mathematical and value chain model-based diagrammatic analysis method. This approach is expected to overcome the complexity of quality management in the company's internal and external value chain linkages. The development of this analytical tool begins by exploring the theoretical role of the value chain and quality costs in the context of SCM, examining the existence of various types of activities in the value chain and their impact on quality costs using a simple mathematical approach, and performing several diagrammatic simulations to visualize and test the logic of the conceptual framework under consideration."

Reviewer comment R2

Well addressed

Page 3/61 lines 50-53, "From a total cost..... supplied by its suppliers", Please do not use the same word (due to) twice in a sentence.

Author's response:

Thank you. I have modified the sentence: "From a total cost of ownership (TCO) perspective, the quality cost is a hidden cost that arises when a company tries to reduce quality problems due to the price variability of raw materials supplied by its suppliers."

Comment:

Value Chain.

What the authors support in this sub-section is already known to the reader

Author's response:

I have added to the results of a study in Australia linking the value chain to quality (Prajogo et al., 2008) in Value Chain Section.

Reviewer comment R1

Well addressed.

Page 5/52, line 18, "..... activities' economics of activities", Please do not use the same word twice in a sentence.

Author's response:

Thank you. The same words have been deleted. Now the sentence is: "The activities should be separated or grouped. It can be based on differences in economics of activities, technology, activity costs, or significance of potential value (Li, 2018; Porter, 1998; Zhang, 2005).

Reviewer comment R2:

Well addressed

Author's response:

Thank you.

Page 4/61, line 46, SPA is SCM's second pillar that recommends.....Please check for typos error.

Page 4/61, line 48-49, SCM views the company's cost structure due to strategic positioning decisions to have a competitive advantage", Please check the syntax and re-phrase this sentence.

Page 4/61, line 56-58, "Each part of a company's value chain..... chosen strategic position", Please check the syntax and re-phrase this sentence.

Author response:

Page 4/61, line 46 has been checked and re-phrased; "SPA recommends the company accomplish managerial accounting from a strategic perspective when making strategic decisions."

Page 4/61, line 48-49, has been re-phrased: "The company's cost structure should be part of strategic positioning decisions that relate to competitive advantage creation."

Page 4/61, line 56-58, has been re-phrased: "Depending on the selected strategic position, each group of activities in a company's value chain has a different strategic cost driver that is connected with varying complexity"

Comments:

Page 4/30 lines 50-52, "In other words, the quality cost is any cost that would not be incurred if the quality were perfect", Please check this sentence for grammar error. What the authors support in this sub-section is already known to the reader.

Author's response:

The sentence has been revised: "In other words, the quality cost would not be incurred if the quality were perfect"

Reviewer comment R1:

Please check once again this sentence grammatically.

Author's response:

Thank you. I have changed the sentence into:
"In other words, no poor product, no quality cost."

Reviewer comment R2:

In this sentence there is not a verb.

Author's response:

Thank you. I have re-phrased the sentence, "If a product is perfectly made, there will be no quality costs. In other words, the cost of quality arises because of imperfections in the product."

3. Discussion

Comment:

Page 6,7,8 The majority of the literature references used are not recent.

Author's response:

Reviewer comment R1:

Adequate.

-

Author's response:

Thank you. I have added two recent references to confirm the relationship between quality-related activities and quality cost in the value chain.

1. Pasquini, C., Hespanhol, M.C., Cruz, K.A.M.L. and Pereira, A.F. (2020), "Monitoring the quality of ethanol-based hand sanitizers by low-cost near-infrared spectroscopy", *Microchemical Journal*, Vol. 159, p. 105421.
2. Wang, Y., Huang, A., Quigley, C.A., Li, L. and Sutherland, J.W. (2021), "Tolerance allocation: Balancing quality, cost, and waste through production rate optimization", *Journal of Cleaner Production*, Vol. 285, p. 124837.

Reviewer comment R2:

Well addressed.

Author's response:

Thank you.

In Table 2 with regard to the literature references provided in the third column, only the year of publication should be included in a parenthesis, not the whole reference, for example: Blocher et al. (2019). Check the writing style of the references according to the Journal's guidelines.

Author's response:

Practical implications added on separate paragraph in the conclusion section ("This study has practical implications. Company managers will be able to analyze the strategic contribution of their departments or activities to quality costs at the departmental or organizational level easier using the QCC map; This map also helps managers control and improve quality cost performance effectively and efficiently. Of course, as an inter-departmental analysis instrument, the detail and the completeness of related information such as costs and activities has a very vital role.")

Reviewer comment R1:

Not well addressed. Please provide more clear and analytical implications for practitioners and researchers also. It is suggested provide the practical implications in a separate section. Page 21-52 lines 50-52, "...at the departmental or organizational level easier using the QCC map" Please check the full-stop.

Author's response:

Thank you. I have created a separate section for implications (under the conclusions and implications section). I have provided more clear practical implications in the first paragraph:

Implications

This study has practical implications. Company managers can quickly analyze the strategic contribution of their departments or activities to quality costs at the departmental or organizational level using the QCC map. This map helps managers identify the linkage

1
2
3 between activities and quality cost-related activities in all value chains, improve it in a
4 centralized or distributed manner by considering FC/PAC, TQC, FC/PC, and AC/PA,
5 respectively, and monitor them. Of course, as an inter-departmental analysis instrument, the
6 detail and the completeness of related information such as costs and activities have a vital
7 role.
8

9 The theoretical implication and future research opportunities are explained in the second
10 paragraph. This research has limitations. This study only discusses the relationship between
11 quality costs and activities related to quality management in the PAF quality cost model, not
12 cost behavior. This limitation opens up opportunities for future research that intends to link
13 QCC with cost behavior in the context of managerial accounting and Strategic Cost
14 Management. The use of QCC in certain industrial areas is the next research opportunity. The
15 variety of PAF activities this study addresses originates from a wide range of industrial sectors;
16 QCC research by sector may produce unique industrial quality cost phenomena.
17
18

19
20 **Author's response:**

21 The limitation of the study and the future research recommendations added on the last
22 paragraph in the conclusion section ("This research has limitations. This study only discusses
23 the relationship between quality costs and activities related to quality management in the PAF
24 quality cost model, not cost behavior. This limitation opens up opportunities for future research
25 that intends to link QCC with cost behavior in the context of managerial accounting and
26 Strategic Cost Management. The use of QCC in certain industrial areas is the next research
27 opportunity. The variety of PAF activities this study addresses originates from a wide range of
28 industrial sectors; QCC research by sector may produce unique industrial quality cost
29 phenomena.")
30

31
32 **Reviewer comment R1:**

33 Well addressed.

34
35 **Author's response:**

36 Thank you.
37
38

39
40 **Reviewer comment R2**

41 Page 22/61, lines 49-50, "Last, it is crucial to investigate the new possible quality concerns
42 long-term investigation". Please check the syntax, and re-phrase this sentence.
43 Page 22/61, lines 57, ".....the linkage between activities and quality cost-related
44 activities.....", Please re-phrase.

45
46 **Author's response:**

47 Thank you.

48 I have re-phrased page 22/61, lines 49-50, "[Last, it is crucial to conduct a long-term investigation of the
49 new possible quality concern.](#)"

50
51 And re-phrased page 22/61, lines 57, "[This map helps managers identify the linkage between activities
52 and quality cost in all value chains](#)"
53

54
55 **Additional Questions:**

56
57 1. Originality: Does the paper contain new and significant information adequate to justify
58 publication?: The paper has been substantially improved; however, minor improvements
59 should be made prior to publication
60

1
2
3
4 2. Relationship to Literature: Does the paper demonstrate an adequate understanding of the
5 relevant literature in the field and cite an appropriate range of literature sources? Is any
6 significant work ignored?: The paper demonstrates an adequate understanding of the relevant
7 literature in the field and cites an appropriate range of literature sources
8
9

10
11 3. Methodology: Is the paper's argument built on an appropriate base of theory, concepts, or
12 other ideas? Has the research or equivalent intellectual work on which the paper is based
13 been well designed? Are the methods employed appropriate?: The theoretical background
14 has been improved.
15
16

17
18 4. Results: Are results presented clearly and analysed appropriately? Do the conclusions
19 adequately tie together the other elements of the paper?: The results are adequately
20 presented and discussed.
21

22
23 5. Implications for research, practice and/or society: Does the paper identify clearly any
24 implications for research, practice and/or society? Does the paper bridge the gap between
25 theory and practice? How can the research be used in practice (economic and commercial
26 impact), in teaching, to influence public policy, in research (contributing to the body of
27 knowledge)? What is the impact upon society (influencing public attitudes, affecting quality of
28 life)? Are these implications consistent with the findings and conclusions of the paper?: The
29 implications of the present study are adequately presented.
30
31

32
33 6. Quality of Communication: Does the paper clearly express its case, measured against the
34 technical language of the field and the expected knowledge of the journal's readership? Has
35 attention been paid to the clarity of expression and readability, such as sentence structure,
36 jargon use, acronyms, etc.: The quality of communication is good. However, the paper could
37 be edited in English by a native English teacher.
