PREFACE

Praise the God for the guidance and wisdom to let the authors finish this research report entitled *Modelling of Liquid Fuel Production Via Catalytic Cracking of Palm Oil Using MCM-41 As Catalyst*. This research report was made to fulfill one of the requirements needed in achieving Bachelor of Engineering (*Sarjana Teknik*) degree in Chemical Engineering Department, Engineering Faculty, Widya Mandala Surabaya Catholic University.

The authors would like to acknowledge these people for their support and role in the construction of this research report,

1. Suryadi Ismadji, Ir., M.T., Ph.D. and Yohanes Sudaryanto, Ir., M.T as the supervisors of this research.
2. Richard Ruskit Gunawan, S.T., Ph.D, Aylianawati, S.T., M.Sc., Ph.D., and Herman Hindarso, S.T., M.T. as the examiners of this research.
3. Professor Subhash Bhatia and Dr. Farouq Twaiq from Universiti Sains Malaysia for their explanation about their journals.
4. Nico Wibisono, S.T. for his help in preparing the catalyst.
5. Dessy Yovita and Giyanto Wijaya Salim for their help in finishing this research project.
6. Martina, ST. for helping in analyze our product experiments.
7. Other lecturers who helped the author in conducting this research.
8. The authors' parents for giving support and blessing.
9. The authors' colleagues for their support and inspiration.
10. Other persons, who were not mentioned, for their help.

The authors realize that this research report is still imperfect. Therefore, the authors will gladly accept any critics and recommendations to further perfect this report. In the end, the authors hope that this report will be useful for all the readers.

Surabaya, December 1st 2007

The authors

ABSTRACT

The objective of this study was to determine the reaction kinetics of the catalytic cracking of palm oil over MCM-41 as a catalyst at the higher C/O ratio and WHSV. The kinetic values obtained from this study can be used further for industrial purpose.

In this study, palm oil was cracked using MCM-41 as a catalyst in a fixed bed micro-reactor. The experiment was conducted at the atmospheric pressure, with reaction temperature of 623.15 K, 673.15, and 723.15 K, Weight Hourly Space Velocity (WHSV) of 15, 17.5, 20, 22.5, 25, 27.5, and 30 h⁻¹, and C/O (catalyst/oil) ratio of 1:32.5. The kinetic model used in this study was the three-lump model developed by Weekman, which involves parallel cracking of palm oil to Organic Liquid Product (OLP) and gas plus coke, with consecutive cracking of the OLP to gas plus coke. The model can represent the experimental data fairly well.

From the study, the rate constant values k_1 , k_2 , k_3 for reaction temperature of 623.15 K were found to be 9.3964, 1.7581 and 0.4732 h⁻¹, respectively. For reaction temperature of 673.15 K, the rate constant values were 20.0346, 3.5761 and 0.5977 h⁻¹. For reaction temperature of 723.15 K, the rate constant values were 28.2084, 5.1278 and 0.6639 h⁻¹. Using the Arrhenius equation, the activation energy is 41.49, 40.36 and 12.78 kJ/mol for E_1 , E_2 , and E_3 , respectively.

ABBREVIATION

- UPO = Unconverted Palm Oil
- C/O = catalyst to oil weight ratio
- OLP = Organic Liquid Product
- WHSV = Weight Hourly Space Velocity

NOMENCLATURES

WHSV = Weight Hourly Space velocity (h^{-1})

τ = holding time (h)

C_{OLP} = Concentration of organic liquid product (% weight)

C_{P} = Concentration of unconverted palm oil (% weight)

$C_{\text{gas+coke}}$ = Concentration of gas + coke (% weight)

k_1 = palm oil cracking rate constant to OLP (hr^{-1})

k_2 = palm oil cracking rate constant to gas + coke (hr^{-1})

k_3 = OLP cracking rate constant to gas + coke (hr^{-1})

E = activation energy (kJ/mol)

T = temperature (K)

k_{10} = Arrhenius constant for palm oil cracking to OLP (hr^{-1})

k_{20} = Arrhenius constant for palm oil cracking to gas + coke (hr^{-1})

k_{30} = Arrhenius constant for OLP cracking rate constant to gas + coke (hr^{-1})
